REGENTS IMAGING

Creatinine: _____

Examination: _____

Your physician has requested that you have an examination, which requires the injection of contrast material into your bloodstream.

Immediately after the injection, many patients notice nausea, a warm and flushed feeling as well as a metallic taste in their mouth. Contrast material is considered quite safe; however, any injection carries slight risk of harm including injury to a vein, infection or reaction to the material being injected. Occasionally, a patient will have a mild reaction to the contrast material and may experience sneezing and develop hives. Uncommonly (about one case in 250,000), a serious reaction to the contrast occurs. The physicians and staff of this facility are trained to treat these reactions.

Please indicate if you have any of the following:

Y N

History of prior contrast material reaction

Severe Heart Disease

Kidney Disease

Severe Allergies or Asthma If yes, please list _____

Diabetes YES NO

If yes, do you take Glucophage, Glucovance, Metformin, Metaglip, or Avandament YES NO

Have you ever had a previous examination with radiographic contrast material injected into your veins? YES NO

If yes, were there any problems: _____

Please direct any questions concerning this examination to the Imaging Staff who will be happy to discuss your questions with you.

I have read this form and understand this form and give my consent for intravenous contrast injection.
